

Table 10-9: Defined Criteria for HIV-Associated Minor Cognitive-Motor Disorder

**Probable Diagnosis
(must meet all four criteria)***

1. Acquired cognitive/motor/behavioral abnormalities verified by both a reliable history and by neuropsychological tests
2. Mild impairment of work or activities of daily living
3. Does not meet criteria for HIV dementia or HIV myelopathy
4. No other etiology present

* A possible diagnosis of minor cognitive-motor disorder can be given if criteria 1, 2 and 3 are present and either (1) an alternative etiology is present and the cause of criterion 1 is not certain, or (2) the etiology of criterion 1 cannot be determined because of incomplete evaluation.
